

Text Generation using N-gram Language model

The screenshot displays a Google Colab notebook interface with the following components:

- Browser Tabs:** Classroom Management Tools, LAB EXPERIMENT - 1, and the active tab, 'Untitled21.ipynb - Colab'.
- Address Bar:** colab.research.google.com/drive/1Hl-szGNuRkAvOGgJbQvNRXfoHQPk#scrollTo=UYUb_NTEPUQ
- Notebook Header:** 'Untitled21.ipynb' with a star icon, a 'Share' button, and a menu bar (File, Edit, View, Insert, Runtime, Tools, Help).
- Code Editor:** Contains five code cells:
 - Cell [1]:** Imports `defaultdict` and `Counter` from `collections`, `nlTK`, and `corpus` from `nlTK`.
 - Cell [2]:** Downloads the 'brown' corpus, extracts sentences and tokens, and prints the total number of tokens (1161192).
 - Cell [4]:** Defines a `build_ngram` function to create n-gram models. It builds bigram and trigram models from the tokens and prints 'Models Ready'.
 - Cell [5]:** Defines a `predict_next` function that takes a context and a model to predict the next word based on the most common words in the model.
 - Cell [6]:** Prints the bigram prediction for the context 'government' and the trigram prediction for the context 'the government decided'.
- Output:** The output of the final cell shows the bigram prediction as a list of words: `['of', '.', ',', 'and', 'was']` and the trigram prediction as an empty list: `[]`.
- Footer:** Includes a status bar with 'Variables', 'Terminal', a progress indicator, the time '8:28 AM', and the Python version 'Python 3'.
